

Inventory Management Policy

This document defines the inventory monitoring and reorder policy used by the AI inventory agent.

Policy Rules:

- 1. Each product has a predefined threshold level.
- 2. If current stock falls below the threshold level, the system should trigger a purchase order.
- 3. The default reorder quantity is based on historical demand and supplier lead time.
- 4. Suppliers are selected based on product category and delivery reliability.

Example:

If Laptop stock drops below 5 units, the system should automatically recommend creating a purchase order for 10 units from Dell Supplier.

Product	Threshold	Default Order Quantity
Laptop	5	10
Mouse	20	50
Keyboard	15	40
Monitor	7	15
Headphones	10	25
